

### **HEIGHTENED SECURITY:** A Networked and Archived Surveillance Solution

#### **SITUATION**

---

A mid-sized courier company headquartered in Pennsylvania was stuck with an unusable surveillance system. They had separate, decentralized cameras at each location, no manuals, no technical support, and no idea of what to do with them. A fly-by-night company sold them a very low-end, unreliable surveillance system that did not address their business needs.

#### **SOLUTION**

---

After sitting down with the company's management to find out what areas they needed surveillance for and how long they needed to be able to access information, we implemented a fully-integrated web-based system, Enterprise Surveillance Manager. The company is now able to log in from anywhere and at any time to view what the cameras are capturing. This system also has an archival function, enabling playback of captured video for up to 1 month; these videos can be exported in various formats as well. Other functionality that was achieved is the ability to synchronize the playback of several cameras to capture views from multiple angles. Because IPConfigure software is scalable, the company has the ability to add more cameras as needed without purchasing a new system. All data is stored on an SQL server, so the company does not have to worry about occupying valuable memory space.

#### **RESULTS**

---

After we implemented a new surveillance system at 4 of their sites, this courier has been able to continually save money by reducing the risk of theft. They can now rely on this system to capture video, track activities, and grow with the company as they grow.
